

# Uddeholm Calmax<sup>®</sup>

## Uddeholm Calmax®

### TOOLING ENVIRONMENT

Many presswork tools used today are still made of standard steel grades of which some of them were developed already around 1930. The poor toughness, flame and induction hardenability of these grades often results in low productivity and high maintenance costs due to unexpected tool failure. Uddeholm Calmax offers due to its higher toughness a higher degree of safety that is essential for better tooling performance and productivity.

### PROPERTY PROFILE

Uddeholm Calmax is a tool steel with property profile devoted to safe production, i.e. high chipping and cracking resistance and fairly good wear resistance.

### APPLICATIONS

The property profile of Uddeholm Calmax makes it very suitable for low to medium production volume tooling exposed to high stresses.

Edition 9, 05.2021

## GENERAL

Uddeholm Calmax is a chromium molybdenum-vanadium alloyed steel characterized by:

- High toughness
- Good wear resistance
- Good through hardening properties
- Good dimensional stability in hardening
- Good polishability
- Good weldability

|                         |                                 |            |           |           |           |          |

## APPLICATIONS

The excellent combination of toughness and wear resistance makes Uddeholm Calmax suitable for different applications.

### TYPICAL COLD WORK APPLICATIONS

- Blanking and forming
- Heavy duty blanking and forming
- Deep drawing
- Coining
- Cold extrusion
- Rolls
- Shear blades
- Prototype tooling

### PLASTIC MOULDING APPLICATIONS

- Long run moulds
- Moulds for reinforced plastics
- Moulds for compression moulding

## PROPERTIES

Samples hardened at 960°C/30min and double tempered at 450°C.

### PHYSICAL DATA

### COMPRESSIVE STRENGTH

Approximate values at room temperature.

| Hardness<br>HRC | R <sub>cm</sub><br>N/mm <sup>2</sup> | R <sub>c0,2</sub><br>N/mm <sup>2</sup> |
|-----------------|--------------------------------------|--|
| 56              | 2300                                 | 1900                                   |
| 58              | 2500                                 | 2000                                   |
| 60              | 2700                                 | 2100                                   |

### IMPACT STRENGTH AND HARDNESS

Approximate values at room temperature for different tempering temperatures. Hardened at 960°C (1760°F). Quenched in air. Tempered twice.

Bar dimension 315 x 80 mm. Samples from centre of bar in ST (thickness) direction.

## HEAT TREATMENT

### SOFT ANNEALING

Protect the steel and heat through to 860°C (1580°F), holding time 2h. Cool in furnace 20°C/h to 770°C (35°F/h to 1420°F), then 10°C/h to 650°C (18°F/h to 1200°F) and subsequently freely in air.

### STRESS RELIEVING

After rough machining the tool should be heated through to 650°C (1200°F), holding time 2h. Cool slowly to 500°C (930°F), then freely in air.

### HARDENING

Preheating: 600–750°C (1110–1380°F).

Austenitizing temperature: 950–970°C (1740–1780°F), normally 960°C (1760°F).

| Temperature |      | Holding* time<br>minutes | Hardness<br>before tempering<br>(HRC) |
|-------------|------|--------------------------|---------------------------------------|
| °C          | °F   |                          |                                       |
| 950         | 1740 | 30                       | 62                                    |
| 960         | 1760 | 30                       | 63                                    |
| 970         | 1780 | 30                       | 64                                    |

\* Holding time = time at austenitizing temperature after the tool is fully heated through

*Protect the part against decarburization and oxidation during hardening.*

### QUENCHING

- Forced air/gas.
- Vacuum furnace with sufficient overpressure.
- Martempering bath or fluidized bed at 200–550°C (320–1020°F) followed by forced air cooling.
- Oil.

*Note 1:* Quenching in oil gives an increased risk for dimensional changes and cracks.

*Note 2:* Temper the tool as soon as its temperature reaches 50–70°C (120–160°F).

*Hardness and retained austenite as a function of austenitizing temperature.*

Risk for grain growth and reduced toughness.

### CCT-GRAPH

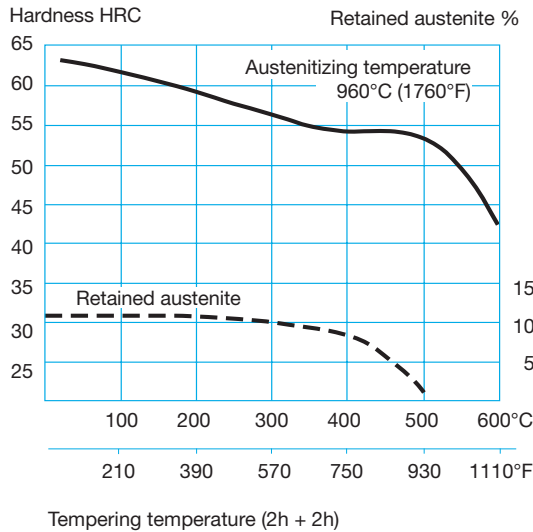

Austenitizing temperature 960°C (1760°F). Holding time 30 minutes.

## TEMPERING

Choose the tempering temperature according to the hardness required by reference to the tempering graph. Temper twice with inter-mediate cooling to room temperature. Lowest tempering temperature 180°C (360°F). Holding time at temperature minimum 2h.

### TEMPERING GRAPH

Above tempering curve is obtained after heat treatment of samples with a size of 15 x 15 x 40 mm, cooling in forced air. Lower hardness can be expected after heat treatment of tools and dies due to factors like actual tool size and heat treatment parameters.

## DIMENSIONAL CHANGES

The dimensional changes during hardening and tempering vary depending on temperature, type of equipment and cooling media used during heat treatment.

The size and geometric shape of the tool are also of essential importance. Thus the tool should always be manufactured with enough working allowance to compensate for distortion. Use 0,20% as a guideline for Uddeholm Calmax.

Typical blanking die where Uddeholm Calmax could be used because of the high demands on toughness.

An example of dimensional changes for a plate 100 x 100 x 10 mm, hardened and tempered under ideal conditions, is shown in the figure below. Hardening: 960°C (1760°F)/30 min./air.

## SURFACE TREATMENT

Some tools are given a surface treatment in order to reduce friction and increase tool wear resistance. The most commonly used treatments are nitriding and surface coating with wear resistant layers of titanium carbide and titanium nitride (CVD, PVD).

Two commonly used nitriding processes are ion nitriding and gas nitriding. Ion nitriding is normally performed at a lower temperature than gas nitriding and is, therefore, the preferred method for Uddeholm Calmax when a substrate hardness of ~54 HRC is required.

| Nitriding process | Temp. °C (°F) | Time (h) | Case depth μm | Substrate hardness HRC | Case hardness HV |
|-------------------|---------------|----------|---------------|------------------------|------------------|
| Ion               | 465* (870*)   | 18       | 200           | 54                     | 1075             |
| Gas               | 510* (950*)   | 12       | 200           | 52                     | 1075             |

\* The nitriding temperature used should be 15–25°C (59–77°F) lower than the previously used tempering temperature

A thick case depth considerably reduces the toughness of the tool. The case depth, which can be controlled by the nitriding time, should be selected to suit the application in question.

Uddeholm Calmax can also be CVD coated but the deposition temperature should not exceed 960°C (1760°F). The tool should be re-hardened after being coated.

PVD coatings are usually deposited at temperatures between 200°C (390°F) and 500°C (930°F). If 200°C (390°F) is used, the Uddeholm Calmax substrate hardness will be higher than that obtained at a deposition temperature of 500°C (930°F). However, the adhesion of the coating on the steel is better if a deposition temperature of 500°C (930°F) is used. The PVD deposition temperature should be approx. 20°C (68°F) lower than the previously used tempering temperature.

## MACHINING RECOMMENDATIONS

The cutting data below are to be considered as guiding values which must be adapted to existing local condition.

*The cutting data recommendations, in following tables, are valid for Uddeholm Calmax in soft annealed condition to approx 200 HB.*

### TURNING

| Cutting data parameters                   | Rough turning carbide              | Fine turning carbide                  | Fine turning High speed steel |

Cold work product where Uddeholm Calmax would be a good choice for the die.

## WELDING

Good results when welding Uddeholm Calmax can be achieved if proper precautions are taken.

1. Always keep the arc length as short as possible. The electrode should be angled at 90° to the joint sides to minimize undercut. In addition, the electrode should be held at an angle of 75–80° to the direction of forward travel.
2. For large repairs, weld the initial layers with a soft weld metal. Make the two first layers with the same electrode diameter and current.
3. Large repair welds should be made at elevated temperature.
4. The joints should be prepared properly.

## TIG WELDING RECOMMENDATIONS

| Consumables                                       | Hardness as welded     | Hardness after rehardening | Preheat temper           |
|---|------------------------|----------------------------|--------------------------|

|   | 58–61 HRC              | 58–61 HRC                  |                          |

## MMA (SMAW) WELDING RECOMMENDATIONS

| Consumables                      | Hardness as welded | Hardness after rehardening | Preheat temper           |
|----------------------------------|--------------------|----------------------------|--------------------------|
| UTP 67S<br>CALMAX/<br>CARMO WELD | 55–58 HRC          | 52 HRC                     | 200–250°C<br>(390–480°F) |
|                                  | 58–61 HRC          | 58–61 HRC                  |                          |

## HEAT TREATMENT AFTER WELDING

### HARDENED CONDITION

Temper at 10–20°C (50–70°F) below the original tempering temperature.

### SOFT ANNEALED CONDITION

Heat through to 860°C (1580°F) in protected atmosphere. Cool in furnace at 10°C/h to 650°C (18°F/h to 1200°F), then freely in air.

Further information on welding of tool steel is given in the Uddeholm brochure “Welding of Tool Steel”.

## EDM

If spark erosion is performed in the hardened and tempered condition, the tool should be given an additional temper at about 25°C (35°F) lower than previous tempering temperature. Further information is given in the Uddeholm brochure “EDM of Tool Steel”.

## POLISHING

Uddeholm Calmax has a very homogeneous structure. This coupled with its low content of non metallic inclusions (due to vacuum de-gassing during manufacturing) ensures good surface finish after polishing. Further information is given in the Uddeholm brochure “Polishing Mould Steel”.

## FURTHER INFORMATION

Please contact your local office for further information on the selection, heat treatment, application and availability of Uddeholm tool steel, including the publication “Steel for Cold Work Tooling”.

## THE CONVENTIONAL TOOL STEEL PROCESS

The starting material for our tool steel is carefully selected from high quality recyclable steel. Together with ferroalloys and slag formers, the recyclable steel is melted in an electric arc furnace. The molten steel is then tapped into a ladle.

The de-slagging unit removes oxygen-rich slag and after the de-oxidation, alloying and heating of the steel bath are carried out in the ladle furnace. Vacuum degassing removes elements such as hydrogen, nitrogen and sulphur.

In uphill casting the prepared moulds are filled with a controlled flow of molten steel from the ladle. From this, the steel goes directly to our rolling mill or to the forging press to be formed into round or flat bars.

### HEAT TREATMENT

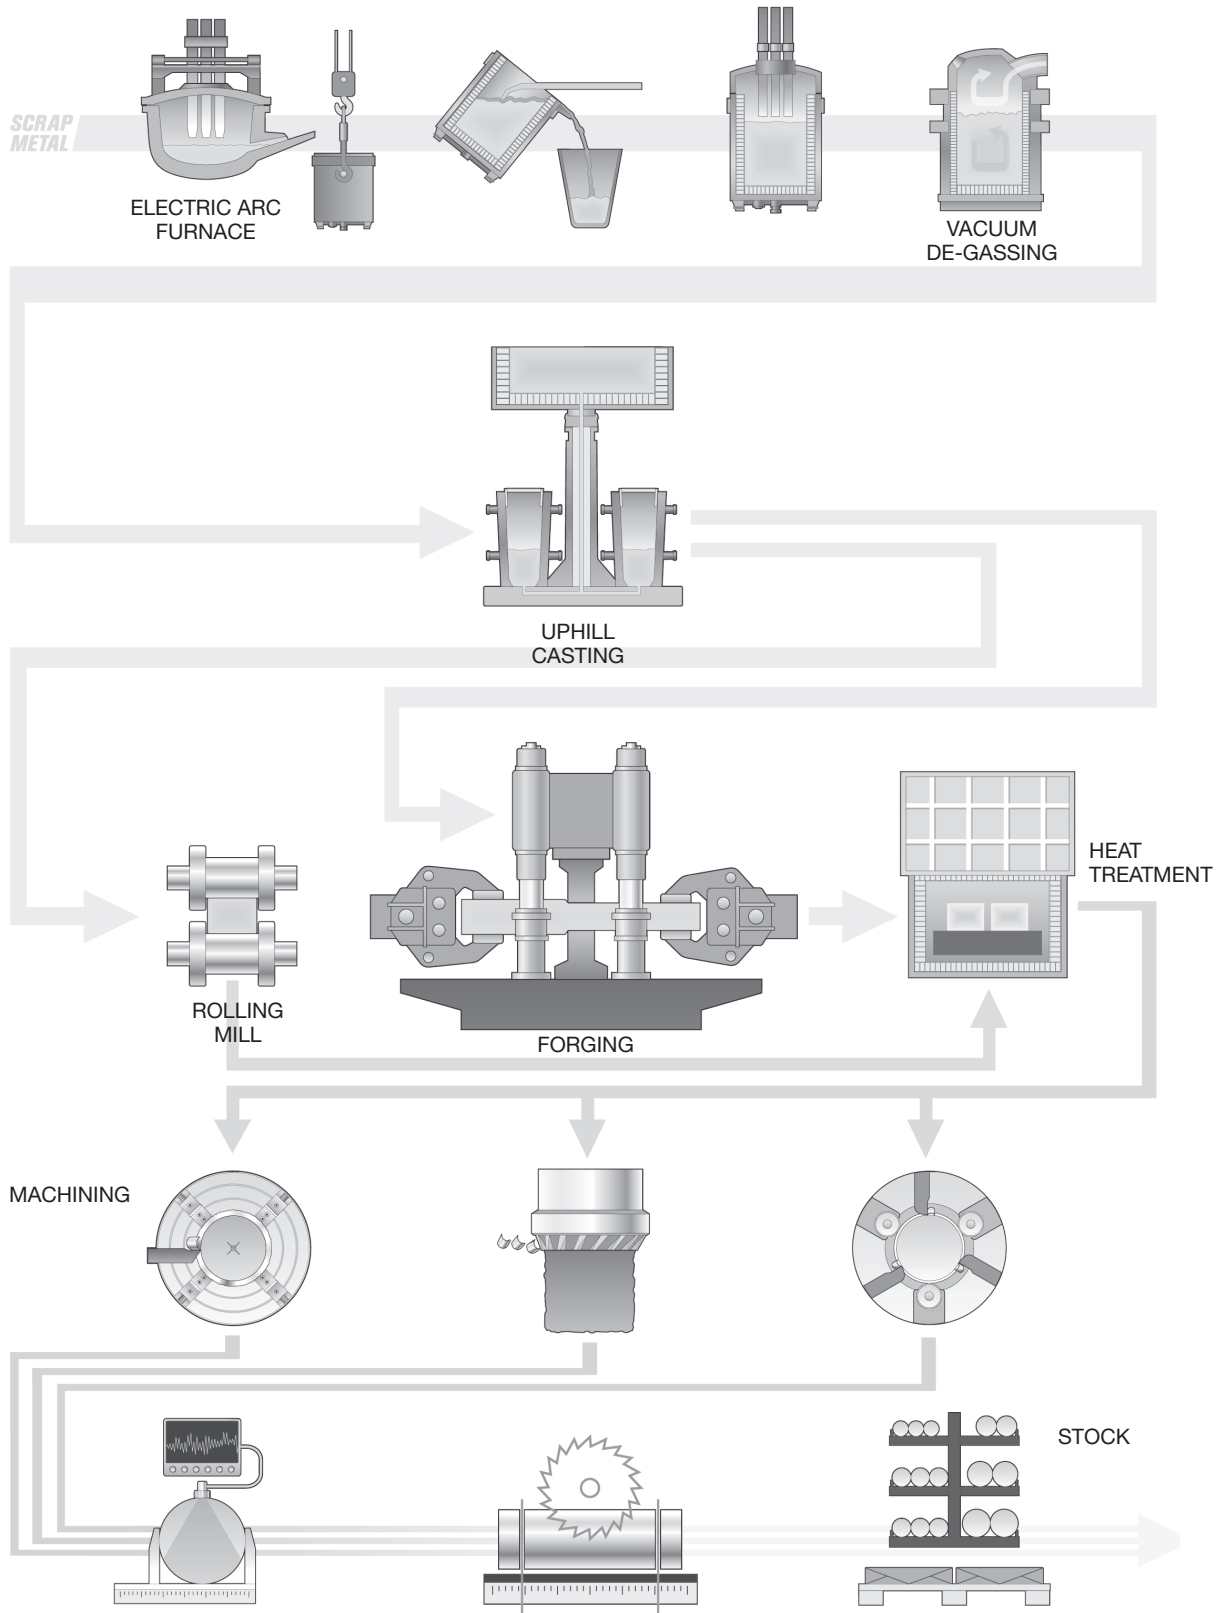

Prior to delivery all of the different bar materials are subjected to a heat treatment operation, either as soft annealing or hardening and tempering. These operations provide the steel with the right balance between hardness and toughness.

### MACHINING

Before the material is finished and put into stock, we also rough machine the bar profiles to required size and exact tolerances. In the lathe machining of large dimensions, the steel bar rotates against a stationary cutting tool. In peeling of smaller dimensions, the cutting tools revolve around the bar.

To safeguard our quality and guarantee the integrity of the tool steel we perform both surface- and ultrasonic inspections on all bars. We then remove the bar ends and any defects found during the inspection.

Manufacturing solutions for generations to come

# SHAPING THE WORLD®

We are shaping the world together with the global manufacturing industry. Uddeholm manufactures steel that shapes products used in our every day life. We do it sustainably, fair to people and the environment. Enabling us to continue shaping the world – today and for generations to come.
